

# Underground Aquarium Systems Map

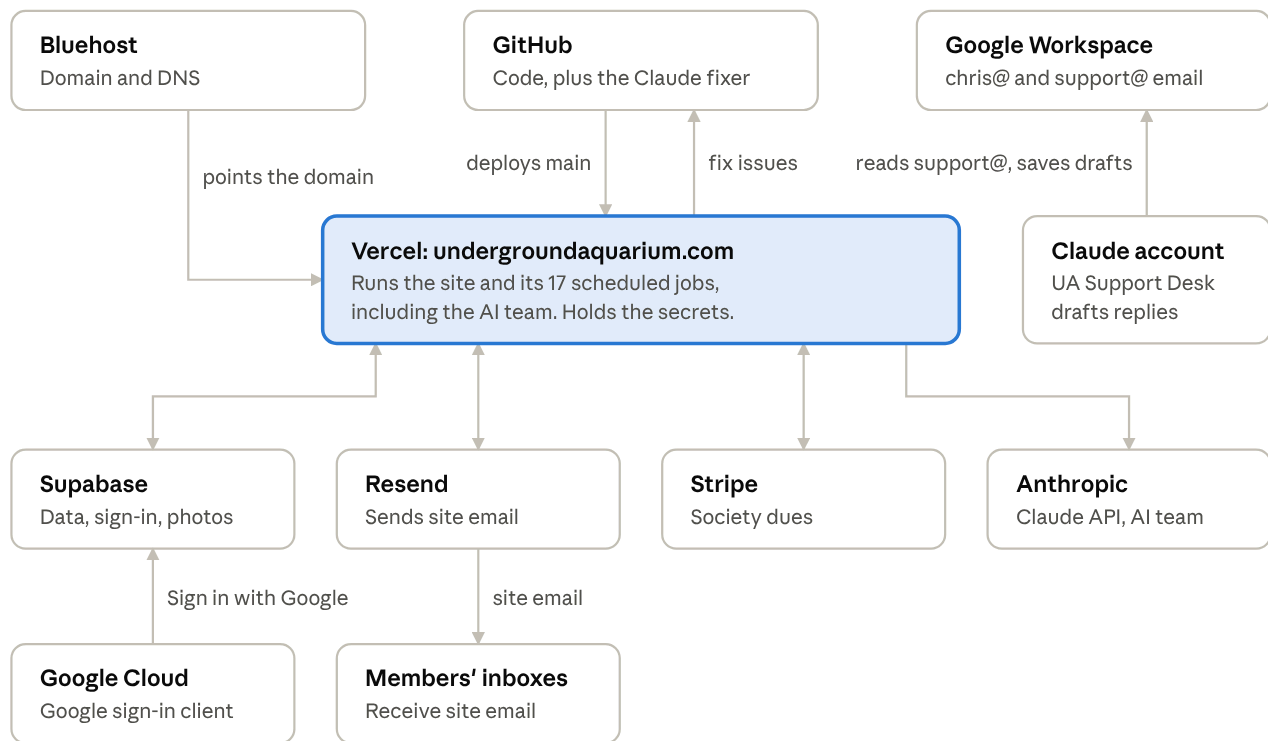

Oct 1, 2026 · @Chris Lewis

Underground Aquarium runs on 11 outside services plus your own code. This page lists every one: what it does, where you manage it, which login owns it, and what to hand over if someone else takes over. It names every secret but never stores a value. Keep the actual passwords and keys in a password manager.

The last section lists what only you know: which email owns each account, plans and renewal dates. Fill it in once, and this page becomes your handover packet.

## At a glance

Everything runs through the site on Vercel

How the services connect

The site on Vercel is the hub: code comes in from GitHub, data lives in Supabase, email goes out through Resend, dues come in through Stripe, and the AI team calls Anthropic. The Support Desk runs separately in your Claude account and only touches Gmail. Not drawn: Instagram (you post it) and Nominatim (free map lookups).

## Services and accounts

If one of these accounts is lost, part of the site stops working, so each needs a known owner login (see To fill in).

| Service                           | What it does for the site                                                                                                | Where you manage it                                                               | Secrets it gives the site                                                                                                   |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Bluehost</b>                   | Owns the domain <code>undergroundaquarium.com</code> and its DNS records (pointing to Vercel, email, Resend)             | <code>bluehost.com</code> , Domains                                               | None                                                                                                                        |
| <b>Vercel</b>                     | Hosts and runs the site. Deploys automatically from GitHub <code>main</code> . Runs all scheduled jobs. Vercel Analytics | <code>vercel.com</code> , team <b>blixx</b> , project <b>underground-aquarium</b> | Holds all of the site's secrets (see next section)                                                                          |
| <b>GitHub</b>                     | Stores the code (repo <b>Blixx23/underground-aquarium</b> ). Runs the Claude code fixer (GitHub Actions)                 | <code>github.com/Blixx23/underground-aquarium</code>                              | <code>OPS_GITHUB_TOKEN</code> (fine-grained token, Issues only)                                                             |
| <b>Supabase</b>                   | Database, member sign-in, and file storage (photos, videos)                                                              | <code>supabase.com</code> , project <b>dbkpyahfrvytnauaggxq</b>                   | <code>NEXT_PUBLIC_SUPABASE_URL</code> , <code>NEXT_PUBLIC_SUPABASE_ANON_KEY</code> , <code>SUPABASE_SERVICE_ROLE_KEY</code> |
| <b>Google Cloud</b>               | The OAuth client behind "Sign in with Google" (configured inside Supabase Auth)                                          | <code>console.cloud.google.com</code> , APIs and Services, Credentials            | Client ID and secret, stored in Supabase Auth, not Vercel                                                                   |
| <b>Google Workspace</b>           | Business email: <code>chris@undergroundaquarium.com</code> , with <code>support@</code> delivering into it               | <code>admin.google.com</code>                                                     | None                                                                                                                        |
| <b>Resend</b>                     | Sends all site email (from <code>send.undergroundaquarium.com</code> ) and reports bounces back                          | <code>resend.com</code>                                                           | <code>RESEND_API_KEY</code> , <code>RESEND_WEBHOOK_SECRET</code> , <code>RESEND_FROM</code> , <code>RESEND_FROM_BULK</code> |
| <b>Stripe</b>                     | Society dues payments (Stripe Connect, Stripe Tax) and the retired paid marketplace                                      | <code>dashboard.stripe.com</code>                                                 | <code>STRIPE_SECRET_KEY</code> , <code>STRIPE_WEBHOOK_SECRET</code>                                                         |
| <b>Anthropic (Claude Console)</b> | The Claude API behind the AI team, and a second key for the GitHub fixer                                                 | <code>platform.claude.com</code> , API Keys and Billing                           | <code>ANTHROPIC_API_KEY</code> (key "UA AI team" in Vercel; key "UA GitHub fixer" in GitHub)                                |
| <b>Claude (your account)</b>      | The <b>UA Support Desk</b> scheduled task, plus the Gmail, GitHub and Canva connectors                                   | <code>claude.ai</code> , Scheduled tasks and Connectors                           | None in the site                                                                                                            |
| <b>Meta (Instagram)</b>           | The Underground Aquarium Instagram account and post scheduling (Meta Business Suite)                                     | <code>business.facebook.com</code>                                                | None                                                                                                                        |
| <b>OpenStreetMap Nominatim</b>    | Turns addresses into map points for shops, events, clubs and regions. Free, no account                                   | Nothing to manage                                                                 | None ( <code>GEOCODE_SECRET</code> protects the site's own geocode routes)                                                  |

## Secrets and settings

The site's secrets live in **Vercel, Settings, Environment Variables**. This list gives names only. If a value is lost, make a new one at the source and paste it into Vercel, then redeploy.

| Name                                                     | What it's for                                                    | Where a new one comes from                       |
|----------------------------------------------------------|------------------------------------------------------------------|--------------------------------------------------|
| <code>NEXT_PUBLIC_SUPABASE_URL</code>                    | Address of the database                                          | Supabase, Project Settings, API                  |
| <code>NEXT_PUBLIC_SUPABASE_ANON_KEY</code>               | Public database key used by browsers                             | Supabase, Project Settings, API                  |
| <code>SUPABASE_SERVICE_ROLE_KEY</code>                   | Full-access database key, server only. The most sensitive secret | Supabase, Project Settings, API                  |
| <code>RESEND_API_KEY</code>                              | Sending email                                                    | Resend, API Keys                                 |
| <code>RESEND_WEBHOOK_SECRET</code>                       | Proves bounce reports really come from Resend                    | Resend, Webhooks                                 |
| <code>RESEND_FROM</code> , <code>RESEND_FROM_BULK</code> | The sender names and addresses on site email                     | You choose them (must be on the verified domain) |

| Name                               | What it's for                                       | Where a new one comes from                                                            |
|------------------------------------|-----------------------------------------------------|---------------------------------------------------------------------------------------|
| <code>STRIPE_SECRET_KEY</code>     | Charging Society dues                               | Stripe, Developers, API keys                                                          |
| <code>STRIPE_WEBHOOK_SECRET</code> | Proves payment events really come from Stripe       | Stripe, Developers, Webhooks                                                          |
| <code>CRON_SECRET</code>           | Lets only Vercel's scheduler run the scheduled jobs | Any long random string you make                                                       |
| <code>GEOCODE_SECRET</code>        | Protects the map-lookup routes                      | Any long random string you make                                                       |
| <code>ANTHROPIC_API_KEY</code>     | The AI team's access to Claude                      | Claude Console, API Keys ("UA AI team")                                               |
| <code>OPS_GITHUB_TOKEN</code>      | Lets the site open Fix with Claude issues           | GitHub, Settings, Personal access tokens                                              |
| <code>NEXT_PUBLIC_SITE_URL</code>  | The site's own address                              | <a href="https://www.undergroundaquarium.com">https://www.undergroundaquarium.com</a> |

## Outside Vercel:

- **GitHub repo secret** `ANTHROPIC_API_KEY` (the "UA GitHub fixer" key) powers the Claude code fixer. It's under the repo's Settings, Secrets and variables, Actions.
- **Google sign-in** client ID and secret live in Supabase, Authentication, Providers, Google.
- **Optional, not set:** `GOOGLE_SERVICE_ACCOUNT_JSON`, `OPS_GMAIL_USER` and `OPS_SUPPORT_ADDRESS` are only needed if the Support Desk ever moves into the site.

## Automatic jobs and connections

Vercel runs 17 scheduled jobs from `vercel.json` in the code. Times are Pacific summer time; in winter each runs an hour earlier. Running any job by hand requires `CRON_SECRET`.

| Job                  | When                     | What it does                                                                  |
|----------------------|--------------------------|-------------------------------------------------------------------------------|
| email-worker         | Every 2 minutes          | Sends queued email through Resend                                             |
| shop-alerts          | Every 10 minutes         | Shop owner alerts and weekly shop reports                                     |
| email-health         | Every 6 hours            | Alerts support@ if email is failing                                           |
| bubble-milestones    | 1 am                     | Bubble milestone awards                                                       |
| purge-accounts       | 2 am                     | Finishes account deletions members asked for                                  |
| expire-listings      | 3 am                     | Expires old classifieds                                                       |
| release-payouts      | 5 am                     | <b>Broken:</b> the route was removed. See the payout note in the AI team plan |
| dues-reminders       | 7 am                     | Society dues reminders                                                        |
| clubs geocode        | 9 am                     | Map points for new clubs                                                      |
| campaign-planner     | 10 am, weekdays          | Plans shop outreach emails                                                    |
| AI team: morning     | 6:30 am                  | Morning session and brief                                                     |
| AI team: activity    | 8 am, noon, 4 pm         | Community Manager and reviewer, only if there's activity                      |
| AI team: weekly, CMO | Mondays 7 am and 7:30 am | Weekly review; Instagram captions                                             |

| Job                   | When                       | What it does                                                                 |
|-----------------------|----------------------------|------------------------------------------------------------------------------|
| AI team: partnerships | Tuesdays 8 am              | Shop pipeline                                                                |
| AI team: QA           | Wednesdays 9 am            | Site health check                                                            |
| AI team: support      | 8:20 am, 12:20 pm, 4:20 pm | Site version of the Support Desk; idle unless Gmail is connected to the site |

### Connections into the site (webhooks):

- Stripe sends payment events to `/api/webhooks/stripe`.
- Resend sends bounce and complaint reports to `/api/webhooks/resend`.
- Every bulk email carries a signed one-click unsubscribe link to `/api/email/unsubscribe`.

If the site moves to a new domain or project, both webhooks must be re-pointed in Stripe and Resend.

### Runs outside the site:

- **UA Support Desk**, a scheduled task in your Claude account, at 8:20 am, 12:20 pm and 4:20 pm. It reads support@ and saves Gmail drafts.
- **Claude fixer**, a GitHub Actions workflow (`.github/workflows/claude.yml`). It runs when a Fix with Claude issue is opened.

## Code and data

The code and the database are the business. Everything else can be rebuilt from them.

| What | Where                                                                                                                           | Notes                                                                                                                             |
|------|---------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Code | GitHub <b>Blixx23/underground-aquarium</b> , branch <code>main</code> . Your copy: <code>~/Developer/undergroundaquarium</code> | Next.js 16, React, TypeScript, Tailwind. <code>CLAUDE.md</code> in the repo explains the rules for anyone (or any AI) changing it |

| What             | Where                                                                                                                                                                                                                             | Notes                                                                                                                                        |

**Backups:** Supabase takes automatic backups on paid plans. Check yours under Database, Backups. GitHub is your code backup, and your Mac has a second copy.

## If you sell or hand off

Transfer ownership service by service rather than handing over your passwords. Most of these services have a built-in transfer, so the buyer gets their own login and you keep yours until the deal closes. Order matters: domain and code first, money last.

- ☐ **GitHub:** transfer the repo to the buyer's account (repo Settings, Transfer ownership). Remove the Claude app and secrets, or let the buyer re-add their own.

- ☐ **Vercel:** transfer the project to the buyer's team (project Settings, Transfer). Environment variables move with it; the buyer should replace every secret with their own.
- ☐ **Supabase:** transfer the project to the buyer's organization (Project Settings, General, Transfer project). This moves the database, sign-in and files together.
- ☐ **Bluehost:** transfer the domain to the buyer's registrar account. Unlock it and get the transfer code (EPP) from Bluehost.
- ☐ **Resend:** the buyer creates their own account, verifies `send.undergroundaquarium.com`, and replaces `RESEND_API_KEY` and `RESEND_WEBHOOK_SECRET`.
- ☐ **Stripe:** Stripe accounts can't move to a new owner. The buyer connects their own Stripe and replaces both Stripe secrets. Cancel or move active dues subscriptions first, and settle any open balances and payouts.
- ☐ **Google sign-in:** the buyer makes their own Google Cloud OAuth client and enters it in Supabase.
- ☐ **Email:** move `support@` to the buyer's mail provider, and update MX records at the domain.
- ☐ **Anthropic:** the buyer uses their own Claude API key in Vercel and GitHub. Delete your keys in the Claude Console.
- ☐ **Claude account:** turn off the UA Support Desk scheduled task (it's yours, not the site's).
- ☐ **Instagram:** transfer the account or Meta Business assets to the buyer.
- ☐ **Rotate everything:** after the hand-off, every secret in the Secrets and settings table should be regenerated so no old key still works.

Give the buyer this page, the one-pager PDF, the code's `CLAUDE.md`, and the admin help at `/admin/help`. Together those explain the whole system.

## To fill in

Only you know these. Type straight into the table. Put the login email here, never the password.

| Service  | Login email | Plan | Monthly cost | Renews or billed | 2-step login on? |
|----------|-------------|------|--------------|------------------|------------------|
| Bluehost |             |      |              |                  |                  |

| Service                       | Login email                   | Plan        | Monthly cost       | Renews or billed | 2-step login on? |
|-------------------------------|-------------------------------|-------------|--------------------|------------------|------------------|
| Vercel (team blixx)           |                               |             |                    |                  |                  |
| GitHub (Blixx23)              |                               |             |                    |                  |                  |

| Claude (your plan)            |                               |             |                    |                  |                  |
| Meta / Instagram              |                               |             |                    |                  |                  |

Two checks worth doing while you fill this in:

- **Use one business login everywhere you can.** For example, chris@undergroundaquarium.com rather than a personal Gmail. A buyer or helper then never needs your personal accounts.
- **Turn on 2-step login** on every row, starting with GitHub, Vercel, Supabase, Stripe and Bluehost. Those five control the whole site.
